

Cardiac Health PDSA

Blood Pressure Control

Step 1

Run a blood pressure report for all patients to see where improvements can be made. This is your baseline.

Step 2

Implement an intervention process. Set a goal, i.e. blood pressure documented per patient visit.

Step 3

Run reports at determined dates to access actual rate of improvement: subtract baseline from new report.

Step 4

Access improvements and change plan accordingly. More than one cycle may be necessary to reach your goal.
